

FOR IMMEDIATE RELEASE

Sol-Ark Goes Mainstream with Sungage Financial

DALLAS – Sol-Ark hybrid inverter systems are now listed on the growing and popular Sungage solar financing approved vendor list. In response to multiple requests from national installers, Sungage and Sol-Ark have established the partnership to further the mission of delivering affordable solar plus storage solutions to homeowners. “We are excited to be a part of a select group of brands working with Sungage. Sungage has quickly proven itself as a leader in providing quick, easy solar financing to homeowners,” according to Bhawna Oberoi, CEO of Sol-Ark. “Customers nationwide will benefit by getting battery-based solar with affordable payments, and solar installers around the country already partnered with Sungage will now be able to offer the most efficient and affordable battery-ready solution on the market to their customers for zero down.”

Necessity is the mother of invention. Sungage was founded in 2011 by Sara Ross, an entrepreneur who was searching for a way to finance her own solar energy system. The company has experienced rapid growth and featured in well-known business media publications such as GreenTech Media and Bloomberg.

Similarly, Sol-Ark was founded in 2013 by veterans and defense engineers searching for an affordable On/Off/Hybrid Grid solution for solar. Experiencing 200% growth year on year, the company has become a cost and full-featured disruptor in the on/off-grid space. Sol-Ark hybrid inverter systems are third party tested to be the most efficient and powerful on the market. 20 kW peak power surge can power a three(3) ton A/C unit off-grid. Turnkey all-in-one box, installers simply plug and play without the need for extra components. Their no-glitch transfer technology is the fastest in the business at just 4 milliseconds, meaning homeowners and businesses will not experience blinking clocks or computer reboots when the grid goes down and their backup kicks in. To put that into perspective, competitors SolarEdge and Tesla are 500x slower, at 2000 milliseconds.
